

## IxNetwork™ – Network Topology Testing and Traffic Analysis

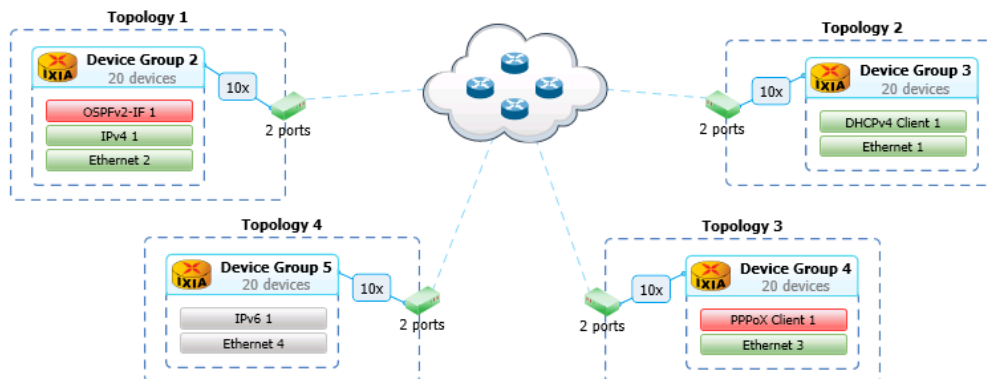

As networks converge into a single network infrastructure that is used to carry voice, video, data, and wireless traffic, it is critical to use leading-edge test systems to assess functionality, scale, and performance. IxNetwork provides wire-rate traffic generation with service modeling that builds realistic, dynamically-controllable data-plane traffic. IxNetwork offers the industry's best test solution for functional and performance testing by using comprehensive emulation for routing, switching, multi-protocol label switching (MPLS), IP multicast, broadband access, authentication, carrier Ethernet, data center bridging (DCB), and software defined networking (SDN) protocols. IxNetwork scales to handle the most powerful devices and largest networks.

IxNetwork offers the customization and flexibility to meet the wide range of requirements necessary for testing complex network topologies with thousands of network devices. It emulates millions of routes and reachable hosts and can customize millions of traffic flows to stress data plane performance. Powerful graphical user interface (GUI) wizards and grid controls allow simplified creation of sophisticated traffic flows. Its enhanced real-time analysis and statistics are capable of reporting comprehensive protocol status and detailed per-flow traffic performance metrics.

IxNetwork introduces Ixia's next-generation protocol framework that brings multi-protocol visibility to a new level. It offers an industry-first high-level summary of port- and protocol-state and the ability to drill down to and control any port, all from a single, visual interface (see diagram).

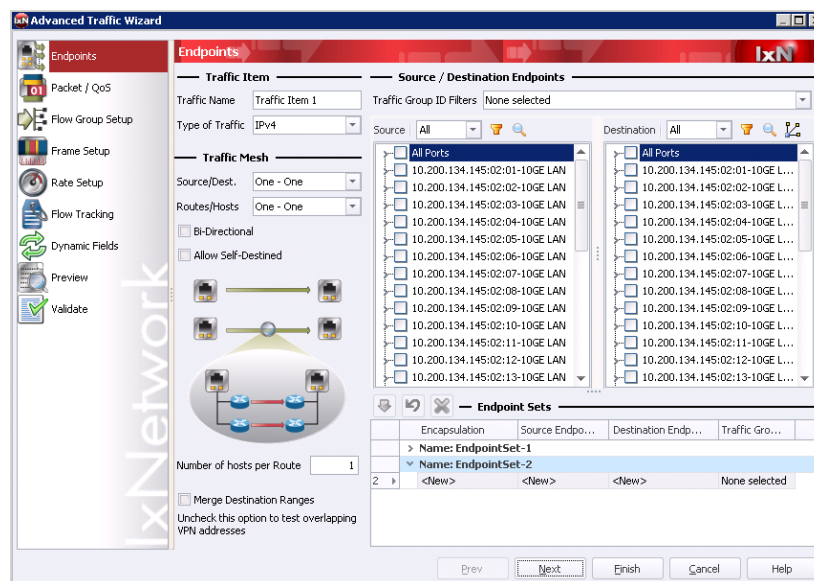

- Fast and efficient configuration of network emulation
- Improved scaling and efficiency
- Flexible protocol stacking to emulate realistic use cases
- Easier use-model with visual representative of test topology and protocol states
- Granular per session control and drill-down view
- Per session learned info and per session failure info for improved diagnostic
- Improved traffic generation flexibility with tagged protocol elements
- Real-world Traffic Mix with AppLibrary

## IxNetwork on IxVM

IxNetwork builds large-scale emulated network and complex traffic topologies using real-world routing and switching. IxNetwork's large library of L2-3 protocols allows advanced testing of multicast scenarios using IGMP, convergence testing for measuring outage duration during live migration, and LACP.

## Protocols

IxNetwork emulates a wide variety of protocols using Ixia's CPU-based test port. Each test port supports an independent multi-core CPU running protocol emulations under a Linux operating system. Using the IxNetwork test application, each Ixia test port is capable of emulating thousands of routers or bridges with millions of reachable networks and hosts. Users can easily scale the size of emulated topologies by adding additional test ports. Combined with line-rate traffic generation and QoS measurement capabilities, the CPU-based load modules verify advertised topologies and networks for reachability and QoS performance.

## Test Results

The IxNetwork statistics viewer is a powerful tool for viewing and analyzing real-time results and generating test reports.

- Aggregate statistics are displayed hierarchically, with the ability to drill-down to group-level and flow-level statistics.
- Different modes to view traffic statistics – Instantaneous, Cumulative, or both
- CSV files can be used to capture a single results view or, at the global level, to capture all results in real-time. An integrated CSV viewer is provided to view large-result files.

**Statistic views**

## Streamlined Workflow

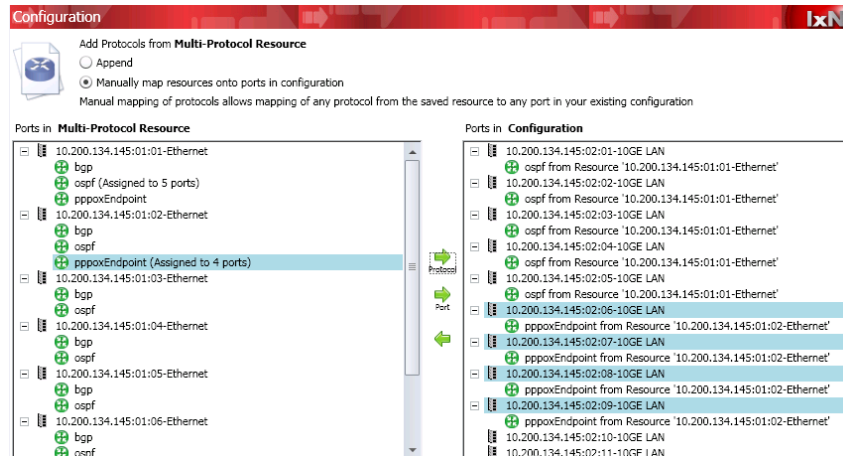

The new GUI greatly reduces clutter by organizing actions into context-sensitive ribbons. It only shows you enabled protocols in the configuration tree, as opposed to everything that is supported by the application. The configuration options exposed in the GUI are context sensitive, and you only see the options based on the element in the navigation tree you are on.

### Streamlined workflow

## Resource Manager

Often expertise for different protocols lies within different members of a testing team. A common pain-point for our customers was the lack of a collaboration tool to aid them in incrementally building configurations. With the Resource Manager, users can now piece-meal their configurations together. The Resource Manager allows users to save different pieces of their configurations, like protocols and traffic elements, and then build a configuration by re-using saved elements in their current configuration.

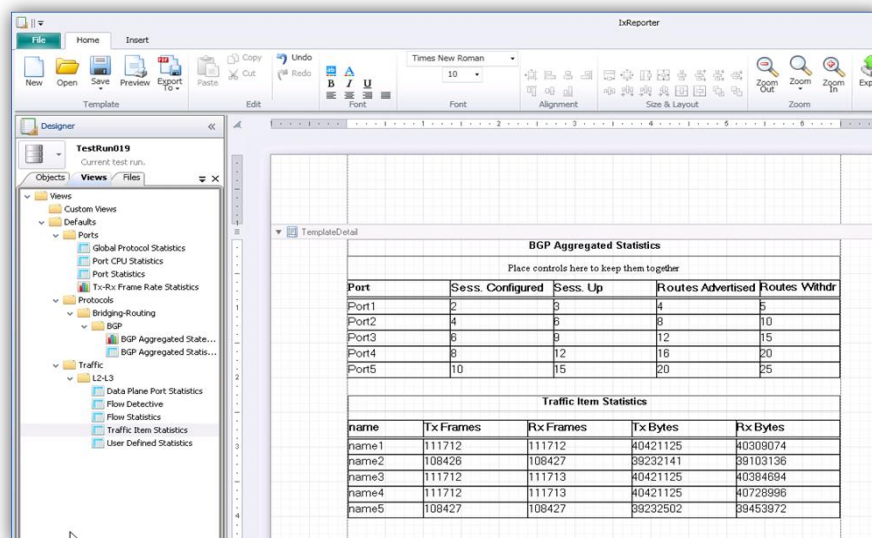

### Resource Manager

It also allows users to clearly see changes made to their resources/configurations by using a “diff” functionality within the application. Using the Resource Manager is a powerful way to collaborate and quickly build expertise with a team.

### IxReporter

Building a test-results report requires test data. IxReporter 2.0 introduces a new database, referred to in the application as an “object model.” The object model is populated by a testing application (like IxNetwork) with the test configuration parameters and the test results. All of these “objects” can be included in a report, usually in a table or chart. With this powerful concept, tables and charts can be created which combine statistics and configuration information as well as have multiple protocols.

### IxReporter

## Automation

IxNetwork provides powerful GUI-based automation with the Test Composer and QuickTests. It also has a robust feature set for GUI-to-script and API-based automation.

- Test Composer provides a GUI-based solution to automate test actions
- QuickTests provides standards-based test methodologies, as well as a custom mode for user-defined performance tests
- ScriptGen provides an easy, one-click GUI-to-script automation solution, as well as a GUI to watch running tests
- IxNetwork provides a full-featured API for automated testing

IxNetwork's automation is simplicity at its best. Test scenarios are set up using IxNetwork's step-by-step GUI, and then a single button-press generates a TCL test script. Scripts may be modified and combined in any fashion. When the script is run, the IxNetwork GUI watches the execution – providing real-time statistics and state information.

## Automation Options

Request	Easy-to-Use	IxNetwork
"I just need a test that can stress my DUT"	QuickTests	Configurable, packaged tests
"I just want to capture what I'm doing in the GUI"	Macro Recorder	Click-thru test automation

"I need control, but I don't want to learn the Tcl API"	Tweakables	GUI driven configuration
"I need low-level control of the test tool"	Tcl, Perl, Python, Ruby, REST API	Total access to the configuration

## Automation Features

## Macro Recorder

With Macro Recorder in IxNetwork 6.00, users can quickly and easily record their interactions with IxNetwork and save these recordings as tests for later use. A user simply turns on the recorder just before they begin the series of steps and interact with the GUI just as they normally do. When done, they stop recording. Macro Recorder captures the GUI interactions during the process and can replay the steps over and over again – saving a lot of time.

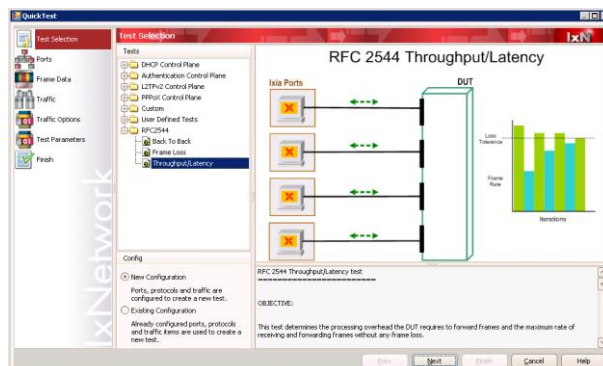

**Macro Recorder**

The user can choose to capture the time in between GUI clicks during the recording so that the pace of the commands is the same when the scenario replays. The user can also choose to take a snapshot of the configuration they are using so that the scenario always starts from the exact same condition as was originally configured.

## QuickTest

An important requirement of network device characterization is measuring throughput, latency, frame loss, and back-to-back rates as defined in RFC 2544. Automated tests use the traffic flows set up by the traffic wizard to perform tests, varying rates and sizes as necessary. QuickTest features include:

- End-to-end wizards for easy step-by-step configuration of test input and parameters
- Ability to run background traffic to load the DUT
- Integration with the ViperCore traffic and statistics engine
- Ability to run RFC test methodologies over routed topologies
- Ability to run strict RFC tests or allow users to customize any configured traffic property after the wizard runs

## Built-In Data Capture and Analysis

Internet protocols are complex – multi-protocol emulations even more so. IxNetwork includes a built-in tool that captures control-plane traffic along with line-rate data-plane traffic, merging both into a single capture file. The optional Analyzer module is a sophisticated network analyzer, with the ability to display protocol ladder diagrams. IxNetwork allows you to trigger and filter control and data plane packet captures based on user-defined packet field.
